DATE _____

PATIENT _____

The above named patient is receiving immunotherapy and has requested that your office administers the allergy injections.

The patient is aware that they must stay at your office for at least 30 minutes after injections are administered to be observed for systemic reaction.

When administered by qualified medical staff, allergy injections are quite safe. But since the patients are by definition highly allergic, there is always some risk of a shot reaction. While the overwhelming majority of reactions are minor, there is always some risk of major, potentially life-threatening anaphylaxis. Therefore, allergy shots should only be administered under the direction of a physician and in a setting where there is immediate access to epinephrine 1:1,000 (1mg/mL), Benadryl IV/IM, O2, etc.

Please note it is imperative that Epinephrine be given at first sign of systemic reaction- DO NOT HESITATE. Call 911 if No immediate improvement or worsening of patient condition.

Kindly acknowledge you are in agreement by signing this letter and faxing it back to us at our dedicated fax line FAX # 301-670-8339. We will send guidelines, schedules and extract.

Thank you.

Sincerely,

Paul M. Goldberg, D.O.
